Project title : Azure Blob Index Tags for Large-Scale Data Organisation

Problem Statement : Managing and searching a large number of blobs in Azure Blob Storage can become difficult and time-consuming.

Traditional methods may require entire space to locate specific files. This project use Azure Blob Index

organise blobs using metadata and enable fast and find the data without scanning the complete files.

Objectives:

To organise large-scale blob data using index tags.

To enable metadata-based searching and filtering of blobs.

To reduce the need for full container enumeration.

To improve the speed and efficiency of data discovery.

To study the limitations of Azure Blob Index Tags.

To understand the performance challenges when applying tags to existing blobs.

Use cases:

Enterprise data management

Financial systems

Healthcare systems

E-commerce

Backup systems

Requirements:

Azure account with Azure Blob Storage.

Storage account with a Blob Container.

Azure Portal and web browser for managing and searching blobs.

Advantages:

Efficient Data Searching.

Better Data Organisation.

Suitable for Large-Scale Data

Faster Data Retrieval.

Abstract : This project focuses on using Azure Blob Index Tags to efficiently organise and discover large volumes of data stored in Azure Blob Storage.

Traditional methods require scanning of entire files and storage, which becomes time-consuming and inefficient as the amount of data increases.

The proposed system uses metadata-based index tags to classify blobs based on attributes such as file type, department, category, or status.

This enables fast and targeted blob discovery without performing full storage files search.

Overall, the solution improves data organisation, search efficiency, and scalability for large-scale storage environments.

Project Architecture :

EXPECTED OUTCOME :

The proposed **“Azure Blob Index Tags for Large-Scale Data Organisation”** project is expected to provide an efficient and scalable method for organising, searching, and retrieving large amounts of unstructured data stored in Azure Blob Storage.
